Dow is a leader in purification, separation and chemical technology, with a longstanding legacy of technology innovation for improving water quality and utilization. Communities throughout the world depend on Dow reverse osmosis membrane technology for desalination and water reclamation. Dow has also made investments that are solving the water-borne disease crisis by bringing affordable, potable water through deployment of low-cost, community-based water systems. In addition, new processes for chemical production have been deployed that dramatically reduce wastewater production, helping to preserve freshwater resources.
